Chapter 10: Storage and File Structure

- File Organization
- Organization of Records in Files

File Organization, Record Organization and Storage Access

File Organization

- The database is stored as a collection of *files*. Each file is a sequence of *records*. A record is a sequence of fields.
- One approach:
 - □assume record size is fixed
 - □each file has records of one particular type only
 - different files are used for different relations

This case is easiest to implement; will consider variable length records later.

Fixed-Length Records

- □ Simple approach:
 - □ Store record i starting from byte n * (i 1), where n is the size of each record.
 - Record access is simple but records may cross blocks
 - Modification: do not allow records to cross block boundaries
- Deletion of record i: alternatives:
 - move records i + 1, . . . , n
 to i, . . . , n 1
 - move record *n* to *i*
 - do not move records, but link all free records on a free list

Free Lists

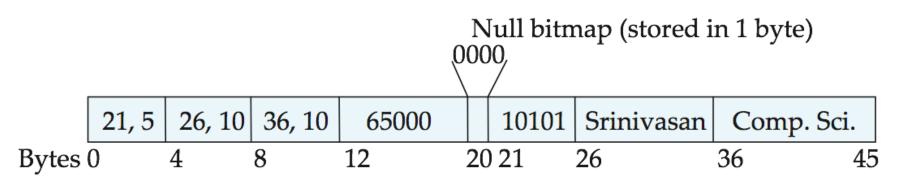

- Store the address of the first deleted record in the file header.
- Use this first record to store the address of the second deleted record, and so on
- Can think of these stored addresses as pointers since they "point" to the location of a record.
- More space efficient representation: reuse space for normal attributes of free records to store pointers. (No pointers stored in in-use records.)

| | | • | ` ' | | |

Variable-Length Records

- □ Variable-length records arise in database systems in several ways:
 - Storage of multiple record types in a file.
 - Record types that allow variable lengths for one or more fields such as strings (varchar)
 - Record types that allow repeating fields (used in some older data models).
- Attributes are stored in order
- Variable length attributes represented by fixed size (offset, length), with actual data stored after all fixed length attributes
- Null values represented by null-value bitmap

Variable-Length Records: Slotted Page Structure

End of Free Space

- Slotted page header contains:
 - number of record entries
 - end of free space in the block
 - location and size of each record
- Records can be moved around within a page to keep them contiguous with no empty space between them; entry in the header must be updated.
- Pointers should not point directly to record instead they should point to the entry for the record in header.

Organization of Records in Files

- Heap a record can be placed anywhere in the file where there is space
- Sequential store records in sequential order, based on the value of the search key of each record
- Hashing a hash function computed on some attribute of each record; the result specifies in which block of the file the record should be placed
- Records of each relation may be stored in a separate file. In a multitable clustering file organization records of several different relations can be stored in the same file
 - Motivation: store related records on the same block to minimize I/O

Sequential File Organization

- Suitable for applications that require sequential processing of the entire file
- The records in the file are ordered by a search-key

| 10101 | Srinivasan | Comp. Sci. | 65000 | |
|-------|------------|------------|-------|--|
| 12121 | Wu | Finance | 90000 | |
| 15151 | Mozart | Music | 40000 | |
| 22222 | Einstein | Physics | 95000 | |
| 32343 | El Said | History | 60000 | |
| 33456 | Gold | Physics | 87000 | |
| 45565 | Katz | Comp. Sci. | 75000 | |
| 58583 | Califieri | History | 62000 | |
| 76543 | Singh | Finance | 80000 | |
| 76766 | Crick | Biology | 72000 | |
| 83821 | Brandt | Comp. Sci. | 92000 | |
| 98345 | Kim | Elec. Eng. | 80000 | |

Sequential File Organization (Cont.)

- Deletion use pointer chains
- Insertion –locate the position where the record is to be inserted
 - if there is free space insert there
 - if no free space, insert the record in an overflow block
 - In either case, pointer chain must be updated
- Need to reorganize the file from time to time to restore sequential order

Multitable Clustering File Organization (cont.)

- □ good for queries involving *department* ⋈ *instructor*, and for queries involving one single department and its instructors
- □ bad for queries involving only *department*
- results in variable size records
- Can add pointer chains to link records of a particular relation

| Comp. Sci. | Taylor | 100000 | |
